Data Structures Practical

Practical - VI

Roll No. : 45	Name: Raj Upadhyay
Class : SY IT	Batch : 1st
Date of Assignment : 29/07/26	Date/Time of Submission : 29/07/26

PART – A : Thoery

A **Binary Tree** is a non-linear data structure in which each node has at most two children: a **left child** and a **right child**.

Tree Traversal is the process of visiting every node of a binary tree exactly once in a specific order. The three basic traversal methods are:

- **Pre-order Traversal (Root → Left → Right):** Visits the root node first, then the left subtree, and finally the right subtree.
- **In-order Traversal (Left → Root → Right):** Visits the left subtree first, then the root node, and finally the right subtree.
- **Post-order Traversal (Left → Right → Root):** Visits the left subtree first, then the right subtree, and finally the root node.

These traversal techniques are commonly used for searching, displaying, and processing the nodes of a binary tree. They are usually implemented using **recursion**.

PART – B : Question

Tree Traversal: Write a program to:

- a. Implement pre-order.

Code:

```
class Node:
    def __init__(self, item):
        self.left = None
        self.right = None
        self.val = item
```

```

def preorder (root):
    if root:
        print(str(root.val) + "->",end = "")
        preorder(root.left)
        preorder(root.right)

root = Node(1)
root.left = Node(2)
root.right = Node(3)
root.left.left = Node(4)
root.left.right = Node(5)

print("\n Preorder Traversal ")
preorder (root)

print("\nRaj 45")

```

Output

```

Preorder Traversal
1->2->4->5->3->
Raj 45

```

b. in-order.

Code:

```

class Node:
    def __init__(self, item):
        self.left = None
        self.right = None
        self.val = item

def inorder(root):
    if root:
        inorder(root.left)
        print(str(root.val) + "->",end = "")
        inorder(root.right)

root = Node(1)
root.left = Node(2)

```

```
root.right = Node(3)
root.left.left = Node(4)
root.left.right = Node(5)
```

```
print("Inorder Traversal ")
inorder(root)
print("\nRaj 45")
```

Output

```
Inorder Traversal
4->2->5->1->3->
Raj 45
```

- c. Post-order traversal of a binary tree.

Code:

```
class Node:
    def __init__(self, item):
        self.left = None
        self.right = None
        self.val = item

def postorder (root):
    if root:
        postorder(root.left)
        postorder(root.right)
        print(str(root.val) + "->",end = "")
```

```
root = Node(1)
root.left = Node(2)
root.right = Node(3)
root.left.left = Node(4)
root.left.right = Node(5)
```

```
print("\n Postorder Traversal ")
postorder (root)
```

```
print("\nRaj 45")
```

Output

Postorder Traversal

4->5->2->3->1->

Raj 45

Curiosity Questions:

1. In a BST, which side (left or right) has **smaller numbers** than the root?
2. If we insert numbers 10, 20, 5 into a BST, which number will be at the root?
3. What will the inorder traversal of a BST give — sorted numbers or random numbers?
4. Where will the **largest number** in a BST always be found?
5. If the root of a BST is 50 and we search for 70, will we go left or right? Why?
6. If a BST has only **one node**, what is its inorder traversal?
7. Can we create a BST from characters like A, B, C instead of numbers?
8. If we insert numbers 5, 10, 15, 20 in order, will the tree be balanced or like a straight line?
9. In a BST, do we check the left child first or the right child first in inorder traversal?
10. If we delete the root of a BST, will the tree disappear?
